### Section 7 Special Tools, Materials and Personnel Protective Equipment

### 7.0 SPECIAL TOOLS AND MATERIALS

### 7.1 **TOOL / MATERIAL DESCRIPTION**

NOTE

THE NE ELECTRA INSTRUMENT WILL BE USED TO PERFORM ALPHA SCANS. ADDITIONAL SURVEY EQUIPMENT APPROVED FOR USE AT RFETS MAY BE USED AS AUTHORIZED BY RADIOLOGICAL ENGINEERING. REFERENCE THE CHARACTERIZATION PLAN (CONTAINED IN APPENDIX 8 OF THIS WORK PACKAGE) FOR INSTRUMENTATION USAGE.

- Ladders (1)
- Sharpie (marking pens)
- Whatman 41, 4.7 cm filter papers
- NE Electra Instrument
- SAC-4 Instrument

NOTE

THE FOLLOWING PPE IS DEFINED AS THE MINIMUM USAGE FOR TRAILER SURVEYS. ADDITIONAL PPE MAY BE ADDED AND DOCUMENTED AT ANY TIME AS NECESSARY. NOTE: SUBSTITUTIONS SHALL NOT BE MADE WITHOUT INDUSTRIAL HYGIENE CONCURRENCE.

### 7.2 PPE

### 7.2.1 **SUBCONTRACTOR**

Initiate site safety compliance by implementing personnel usage of the following PPE as appropriate:

- Safety glasses with side shield (ANSI Z87.1 approved).
- Hard Hat (ANSI Z98.1). Bump Cap (RMRS OPS/DIR-019) is authorized if work area is not posted as specifically requiring hard hat.
- (3) Approved above ankle leather boots, with ANSI Z41.1 approved safety toecaps.
- Leather Gloves (optional-discretion of IH&S).

### Section 8 **Initial Conditions and Prerequisites**

PURPOSE: This standard work package provides instructions for radiological surveys, asbestos inspection and sampling, and inspection of fluorescent light ballasts for purposes of reconnaissance-level characterization or MARSSIM release.

SCOPE: Conduct radiological surveys, asbestos inspection and sampling, and inspection of fluorescent light ballasts

### 8.1 PRECAUTIONS AND LIMITATIONS

- Advise Workers that if any discrepancies, difficulities or hazards are encountered that cannot be safely resolved 8.1.1 within the scope of work, STQP WORK, and immediately inform supervisory personnel. Note: Stop work is in accordance to RMRS Directive 1. Restart will be authorized by the RMRS Vice President or designee.
- 8.1.2 Develop / update A Job Hazard Analysis (JHA) based on the results of a Job Hazard Identification Tool (JHIT) walkdown as required in MAN-071-IWCP, Chapter 3. Place the completed JHA in Appendix 1.
- Dispose of all waste in accordance with 1-P73-HSP-18.10 that includes requirements established by 3-PRO-8.1.3 141-RSP-09.01 "Unrestricted Release of Property, Material, Equipment and Waste", 3-PRO-088-RSP-09.02 "Radioactive Material Transfer and Shipment", and 3-PRO-140-RSP-09.03 "Unrestricted Release of Bulk or Volume Material". Comply with 1-PR0-079-WGI-001 "Waste Generation Instructions", as required and insert authorized instructions in Appendix 3 (titled: Miscellaneous & Field Generated Paperwork).
- 8.1.4 All records generated by this project will become part of the project history file as well as the Administrative Record as applicable.
- 8.1.5 Beware of wasps, nests, snakes and other wildlife that may be in the area. If wildlife cannot be avoided, THEN, contact and request site Ecology to investigate and authorize the continuation of the trailer radiological surveys as required. Call Ecology at x3764, Pager (303) 212-3167, Field Radio Individual #3787, and / or Field Radio Channel EMAD 12.
- Check-off blocks ( $\square$ ) are used for steps that do not require a signature. A check ( $\sqrt{}$ ) or initial signifies 8.1.6 completion.
- 8.1.7 Read the required reading materials prior to initiating work, and sign off the required reading checklist.

NOTE

IF A STEP OR TECHNICAL STATEMENT IS DECLARED NOT APPLICABLE (N/A) BY THE DESIGNATED CONTRACTOR FIELD SUPERVISOR AND / OR SITE ENVIRONMENTAL ENGINEERING REP, MARK "N/A" IN THE SIGNATURE SPACE OR CHECK-OFF BLOCK, WITH INITIALS, EMPLOYEE NUMBER, AND DATE OF ENTRY. RECORD THE REASON FOR THE N/A IN STATUS LOG IN APPENDIX 2.

### 8.2 **PRELIMINARY ACTIONS**

NOTE ACTIONS CAN BE PERFORMED OUT OF SEQUENCE EXCEPT AS SPECIFICALLY NOTED.

### 8.2.1 FIELD SUPERVISOR

Verify that all personnel are trained and qualified to perform tasks as specified in Work Sequence Instructions. Review for Ladder training and Fall Protection training as specified for this work package.

### 8.2.2 FIELD SUPERVISOR

Place and log all current and applicable material MSDSs in Appendix 3. Advise all workers where MSDSs are located for access as required. (N/A if not required).

### 8.2.3 FIELD SUPERVISOR

Initiate POD Evolutionary Request Forms for tasks contained in the Characterization Package contained in Appendix 8, and submit to the Plan of the Week representative.

	Section 8 Initial Conditions and Prerequisites
8.3	SITE PREPARATION
	NOTE ACTIONS CAN BE PERFORMED OUT OF SEQUENCE EXCEPT AS SPECIFICALLY NOTED.
8.3.1	FIELD SUPERVISOR  Arrange work site setup of instruments, tools and materials. Review the JHA contained in Appendix 1 and Comply with safety issues and potential hazard controls as required for site preparation.
8.3.2	FIELD SUPERVISOR Inspect / verify previously established measurement locations identified by griding on floors, walls and ceilings and roofs. In units where griding is not practical, view labels or similar methods used. Signoff as a preliminary for work start.
	FIELD SUPERVISOR / Signature Date
8.4	APPROVALS AND NOTIFICATIONS
8.4.1	FIELD SUPERVISOR  Notify the following organizations a minimum of 24 hours prior to their services being required:
(1)	Radiological Operations
(2)	Industrial Health and Safety
(3)	Radiological Engineering
	NOTE  PRE-EVOLUTION BRIEFINGS MAY BE CONDUCTED AS A PRELIMINARY TO ALL BUILDING SURVEY SAMPLING ANALYSIS PROCESSES INDIVIDUALLY OR COLLECTIVELY. CHANGES IN PERSONNEL AND TASK INSTRUCTIONS REQUIRES NEW PRE-EVOLUTION BRIEFINGS PRIOR TO WORK START.
8.4.2	FIELD SUPERVISOR Conduct pre-evolution briefings and Job Task Review (Safe Work Checklist) per MAN-066-COOP and RMRS OPS-DIR-016. Document pre-evolutionary briefing forms contained in Appendix 4. Briefings shall include all workers (applicable personnel) and be performed prior to the start of any / all work tasks to include site preparation activities.

### Section 10 Post Maintenance Testing Instructions

**PURPOSE:** This section is for work package closure only. All survey, sampling and analysis process requirements were satisified in Section 9.

- 10.1 PRECAUTIONS AND LIMITATIONS
- 10.1.1 NONE
- 10.2 **PREREQUISITES**
- 10.2.1 NONE
- 10.3 POST SURVEY, SAMPLING TESTING
- 10.3.1 NONE
- 10.4 SYSTEM / AREA RESTORATION & WORK PACKAGE COMPLETION
- 10.4.1 RCT / RAD ENG / RAD OPS

Complete post job contamination surveys per Radiological Safety Practices for area, equipment and tools for release. Post or depost areas as applicable. (N/A if not applicable).

10.4.2 FIELD SUPERVISOR

Perform the following:

Ensure that all permits, forms, checklist, logs and reports are complete and returned to the appropriate organization or department.

Ensure all work areas are cleaned at least to the level of cleanliness prior to work start.

NUN

### INTRODUCTION 1.0

This program defines the health and safety requirements for characterization sampling activities. It was designed to ensure that consistent health and safety practices are followed during sampling.

In addition to the requirements specified in this document, a minimum of a job-specific Activity Hazard Analysis (AHA) and a project-specific organization chart are required for each project/sampling event. Additional documents (i.e. Lead Compliance Plan or an addendum to this program) may also be required depending on planned sampling activities. Contact the Characterization Health and Safety Supervisor for assistance.

Characterization sampling may be conducted for waste disposal and worker health and safety purposes. Sampling conducted for worker health and safety purposes is driven by the need to determine the presence, quantity and location of hazardous substances in building materials which may create a health hazard to employees involved in demolition or renovation. The Characterization Health and Safety Supervisor will specify health and safety related sample points, collection methods and analysis for each project/sampling event in accordance with the requirements listed in the compound-specific sections of this document.

### 2.0 SAFE WORK PRACTICES

Sampling will be conducted in a manner which:

- minimizes potential exposure to the sampler,
- eliminates potential exposure to collocated workers,
- minimizes potential for generation of airborne material, and
- ensures no contamination of the work area.

No eating, drinking, smoking, chewing, or applying cosmetics is allowed in the sampling area.

Whenever possible, sampling methods which encase or contain the suspect material will be used. Examples include core samplers used to collect asbestos samples and plastic bags taped to the wall underneath paint chip scraping areas.

Wet sampling methods will be used when feasible to minimize generation of airborne material. This includes surfactant used during asbestos sampling and water mist used during paint chip sampling. All materials resulting from sampling will be removed. If potential asbestos debris or paint chips fall on the floor during sampling, they will be cleaned with wet methods or a HEPA vacuum. Absolutely no contamination of the work area will be left after sampling activities.

Collocated workers and supervisors must be notified about sampling activities and must be kept out of the sampling area. Any potential exposure to collocated workers is unacceptable. Each sampling area will either be guarded by an individual assigned to inform collocated workers about the sampling or marked by caution tape or other means to alert personnel to remain out of the area. If caution tape or other means is used, signs reading "DO NOT ENTER/ CHARACTERIZATION SAMPLING IN PROGRESS/ CONTACT BUILDING MANAGER" will be posted at all entrances to the sampling area.

Document No: Revision No:

January 1999

Page:

2 of 10

Many other hazards may be present during characterization sampling. The work area must be evaluated prior to sampling to identify these hazards, and they must be addressed in the AHA. These may include the following:

### 2.1 ELECTRICAL HAZARDS

Characterization sampling often involves drilling into floors, walls or ceilings. RMRS Operations Directive #006 will be followed to minimize potential of accidental contact with energized electrical utilities during all work involving penetration greater than 2 inches of concrete or masonry pads, floors, walls, ceilings, or asphalt pads.

Lockout/Tagout (LO/TO) is required when potential contact with an electrical power circuit exists. The LOTO Program in the RFETS Health and Safety Practices Manual will be followed. LOTO training is required biennially.

### 2.2 CONCRETE SAMPLING

In addition to inherent electrical hazards, concrete contains silica. If sampling methods generate airborne particles, such as drilling, precautions must be taken. Wet methods will be used. In addition, the following Personal Protective Equipment (PPE) is required:

- a full-face respirator equipped with HEPA cartridges, and
- Tyvek coveralls.

Personal air monitoring for silica will be conducted by the Characterization Health and Safety Supervisor in accordance with NIOSH Method #7500 (See references). If sampling results indicate airborne silica levels less than 25 micrograms of silica per cubic meter of air ( $\mu g/m^3$ ), the PPE may be downgraded during future similar sampling events.

Concrete patch, float, or seal material may contain asbestos. If the material is not known to be asbestos free, it must either be assumed to contain asbestos or must be sampled prior to future disturbance.

### 2.3 FALLS

If sampling personnel must work on unprotected elevated surfaces higher than 6 feet, fall protection is required. Fall Protection Awareness Training is required biennially for employees and their supervisors who work in areas that could result in a fall of 6 feet or more.

### 2.4 LADDERS

Ladders must often be used during sampling activities. Ladder users and their supervisors must have Ladder Safety Awareness Training biennially.

### 2.5 CONFINED SPACES

Confined spaces may need to be entered for sampling purposes. All personnel involved in the entry must have Confined Space Entry Safety Awareness Training annually. A permit is required for all confined space entries.

 RMRS Generic Health and Safety Plan For Characterization Sampling

Document No: Revision No:

Document No: RF/RMRS-98-284

Date: Page:

January 1999

3 of 10

### 2.6 RADIOLOGICAL AND CHEMICAL HAZARDS

A thorough pre-job walk-through involving the Radiological Engineer and Characterization Health and Safety Supervisor must be conducted to identify these hazards. An RWP and/or ALARA Job Review may be required based on potential radiological hazards present. The RWP will specify required radiological controls, PPE, hold points, etc. The ALARA Job Review will specify additional radiological controls.

### 2.7 HEAT AND COLD STRESS

Guidelines established in the American Conference of Governmental Industrial Hygienists (ACGIH) Threshold Limit Values (TLVs) for Heat and Cold Stress will be followed. The Characterization Health and Safety Supervisor will communicate with Medical to ensure that employees involved are medically approved to work in hot or cold environments.

### 2.8 NOISE

The RFETS Health and Safety Practices Manual Hearing Conservation chapter will be followed. All areas with noise levels greater than 85 decibels on the A-weighted scale (dBA) will require posting and the use of hearing protection. The Characterization Health and Safety Supervisor or designee will measure noise levels and post the area if required.

### 2.9 HAZARDS PRESENTED BY OTHER OPERATIONS

It is very important to communicate with the building manager regarding other activities in the area. When possible, sampling will be conducted when no other personnel are present. The AHA will address any additional hazards presented by other operations.

### 3.0 ASBESTOS

All suspect asbestos containing materials potentially involved in the demolition or renovation will be sampled. Asbestos sampling will be conducted in accordance with EPA 40 CFR 763.86, and with applicable sections of Colorado Regulation 8 (CCR 8).

The sample collector must hold a current Colorado State Asbestos Inspector Certification. RCTs or other personnel who may contact but not disturb asbestos must have Asbestos Awareness Training annually. Other sampling personnel must have the one time Asbestos Briefing. All personnel wearing respiratory protection must have current annual Respirator Indoctrination Training and fit test.

Personal Protective Equipment (PPE) required for asbestos sampling includes the following:

- a full-face respirator equipped with HEPA cartridges
- Tyvek coveralls
- leather outer gloves (if cut or pinch hazards exist) (to be disposed of as asbestos waste)
- inner surgeons gloves, and
- disposable shoe covers

Document No: RF/RMRS-98-284 Revision No:

Date:

January 1999

Page:

4 of 10

A current RFETS medical approval to wear a respirator is also required.

The above listed PPE (with the exception of gloves) is NOT required when air monitoring data is provided with the AHA which shows that a similar asbestos sampling activity was monitored in the past twelve months and resulted in airborne asbestos levels less than 0.1 fibers per cubic centimeter of air (Fibers/cc). Gloves are always required.

Personal breathing zone sampling for asbestos may be conducted periodically to assess exposures in accordance with 29 CFR 1926.1101. The Characterization Health and Safety Supervisor or designee will determine when sampling is required and will conduct the sampling.

### 4.0 LEAD

Demolition of structures coated with lead paint may result in employee exposures to lead, depending on the demolition methods used. Therefore, paint may be sampled to determine the content of lead or other metals, or it can be assumed to contain lead. Paint can be sampled by scraping and collecting paint chips or nondestructively by X-ray diffraction. Scrape sampling allows a much lower detection limit [10 parts per million (ppm)] as inductively coupled plasma (ICP) analysis (total metals) is performed in a laboratory. X-ray diffraction has a higher detection limit of 600 ppm lead in paint. However, it is fast (1 minute), accurate, and does not potentially create airborne dusts. X-ray diffraction analysis is suitable for demolition and renovation methods unlikely to result in lead overexposure to personnel above the action level of 30 micrograms of lead per cubic meter of air  $(\mu g/m^3)$ .

Activities for which X-ray diffraction analysis is approved include:

- Cold cutting (shearing or pipe cutting) of material coated with non-oxidized lead based paint, and
- nondestructive disassembly.

For remote demolition methods (heavy equipment), no paint sampling is required. Personal air sampling during previous projects has repeatedly shown that no lead levels were detected during demolition of buildings having lead paint, while using heavy equipment.

Prior to sampling, all employees who sample paint by scraping will receive Lead Awareness Training. This training is required annually. In addition, operators of the Niton X-ray diffraction unit must attend the Niton eight-hour training class prior to sampling.

PPE required for scrape sampling includes the following:

- a full-face respirator equipped with HEPA cartridges
- Tyvek coveralls
- leather outer gloves (to be disposed of or used only for paint scraping)
- inner surgeons gloves, and
- disposable shoe covers

All personnel wearing respiratory protection must have current annual RFETS Respirator Indoctrination Training and fit test.

Document No: RF/RMRS-98-284 Revision No:

Date: Page: January 1999

5 of 10

The above listed PPE (with the exception of gloves) is NOT required when air monitoring data is provided with the AHA which shows that a similar paint scraping activity was monitored in the past twelve months and resulted in airborne lead levels less than the action level. Gloves are always required.

Personal breathing zone sampling for airborne lead is required unless previous representative sampling has been conducted within the past twelve months. The Characterization Health and Safety Supervisor or designee will conduct the monitoring.

Medical surveillance for lead is not required as sampling activities are not expected to result in airborne lead levels above the action level. However, if monitoring results show that this level has been exceeded, all affected personnel will receive lead medical surveillance. If personnel are wearing respiratory protection, medical approval is required.

Sampling locations will be determined based upon planned demolition or renovation activities. The Characterization Health and Safety Supervisor or designee will determine sample location and number of samples. If a full characterization is requested, all paint colors, textures, and ages must be sampled. Care will be taken to sample all layers of paint.

### 5.0 BERYLLIUM

Beryllium smear samples may be taken by RMRS Industrial Hygiene. The following factors are used to determine when sampling for beryllium is required:

- presence of the building on the list of beryllium areas,
- history of the building/ area, and
- potential of employee exposure due to demolition/renovation methods.

Sampling methodology will be in accordance with the RFETS Chronic Beryllium Disease Prevention Program (CBDPP). In addition, biased samples may be collected based on building/area history. Samples will be collected in accordance with the RMRS Beryllium Swipe Sampling Procedure. Samples will be analyzed via ICP.

Surgeon's gloves are the required PPE. Personal breathing zone sampling has shown that respiratory protection for beryllium is not required during beryllium smear sampling. However, if the area is extremely dusty, or if further air sampling shows higher beryllium levels, respirators will be required.

The Beryllium Operations Computer-Based Training (CBT) Course is required for the sampler. A new Beryllium Awareness Training Course is currently being developed, and will replace the Beryllium Operations CBT.

Personal breathing zone samples may be collected by the Characterization Health and Safety Supervisor.

Beryllium medical surveillance is not required unless personal breathing zone samples show airborne beryllium levels exceeding the action level of 0.5 µg/m<sup>3</sup>.

### 6.0 RESPONSIBILITIES

Each person is responsible for the health and safety of themselves and their coworkers, for completing tasks in a safe manner, and reporting any unsafe acts or unanticipated hazards or conditions to the Project Manager, Field Supervisors, or the Health and Safety Officer. All personnel are responsible for continuous adherence to this HASP during the performance of their work. No person may work in a manner that conflicts with the safety and environmental precautions expressed in this document.

### 6.1 RMRS DIRECTOR OR MANAGER OF CHARACTERIZATION OR DESIGNEE

The RMRS Director of Manager of Characterization or designee is responsible for the following:

- liaison activities between Kaiser-Hill Environmental Restoration management and RMRS Project management;
- providing assistance to the Project Manager; and
- issuing approval for restart of the project following suspension of activities.

### 6.2 PROJECT MANAGER

The Project Manager is responsible for overall operations during fieldwork on the site including the health safety of project personnel during site activities. The Project Manger is responsible for implementation of the HASP and protecting surrounding facilities and any potentially affected communities. The Project Manager shall ensure that work crews have adequate resources to effectively perform the tasks required, proper personal protective equipment is being used (as specified in the HASP), and disciplinary actions are enforced when health and safety requirements are not being followed or unsafe practices occur.

### 6.3 HEALTH AND SAFETY OFFICER

The Health and Safety Officer is responsible for overall compliance with and implementation of the HASP and for the safe conduct of operations.

### 6.4 FIELD SUPERVISOR

The Field Supervisor, in coordination with the Project Manager and the Health and Safety Officer, will be responsible for the implementation of this HASP. This will include communicating site requirements to all on site project personnel.

### 7.0 TRAINING

The following is a list of training and medical approvals which may be required. The job-specific List of Qualified Individuals (LOQI) and training matrix included in the readiness assessment will specify required training for each project.

- Asbestos Awareness (RCTs and others who may contact but not disturb asbestos)
- Asbestos Briefing (all other sampling personnel)

RMRS Generic Health and Safety Plan For Characterization Sampling Document No: Revision No:

Document No: RF/RMRS-98-284

Date:

January 1999

Page:

7 of 10

- Asbestos Inspector/Refresher
- Beryllium Operations/ Beryllium Awareness
- Confined Space Entry Safety Awareness
- Fall Protection Awareness
- Ladder Safety Awareness
- Lead Awareness
- Lock Out/Tag Out Training
- Respirator Fit Test
- Respirator Medical Approval
- Training required by the building/area
- 24 hour or 40 hour OSHA as determined by the H&S officer

Daily safety briefings for site employees will be conducted. The briefings will address the day's planned activities, reminders of safety responsibilities, and any safety concerns. These meetings will be documented by the Field Supervisor.

### 8.0 PERSONAL PROTECTIVE EQUIPMENT

For all sampling, the following PPE is required:

- safety glasses with sideshields
- safety-toed work boots
- leather gloves if appropriate
- work clothing (DOE coveralls), and
- hard hat if any overhead or bump hazards exist.

Characterization personnel must wear any additional PPE required by the building/area.

The following PPE may be required based upon the materials being sampled or materials present in the area during sampling.

- full-face respirator equipped with HEPA or other cartridges
- SCBA
- Tyvek or other coveralls
- Protective gloves
- Protective booties
- hearing protection

The Characterization Health and Safety Supervisor and Radiological Engineer or RWP will specify PPE. The required PPE will be listed in the AHA.

Document No: RF/RMRS-98-284 Revision No:

Date: Page: January 1999

8 of 10

### 9.0 MEDICAL SURVEILLANCE

All field personnel working on this task shall meet the medical surveillance requirements found in 29 CFR 1910.120 (f) and participate in RFETS Medical Surveillance Program, in accordance with HSP Section 4.0, with subsequent certification by an occupational physician for physical fitness, the ability to perform hazardous waste work.

The RMRS Health and Safety Officer will review medical documentation from the physician to ensure fitness for duty. Any restrictions will be noted and adhered to.

### 9.0 **AIR MONITORING**

Air monitoring for asbestos or other potential contaminants shall be at the discretion of the Field Supervisor and the Health and Safety Officer. Sampling methods will be used that minimize the potential for worker exposures to hazardous contaminants.

### 10.0 SITE CONTROL

In order to minimize the hazards for non-project personnel, control of the job site shall be the responsibility of the Field Supervisor. All visitors to the site shall not be allowed to work area during sampling activities. The safe distance for visitors to the work area shall be determined by the Field Supervisor.

### 11.0 DECONTAMINATION

Personnel and equipment contamination prevention techniques will be used wherever feasible. When necessary, personnel and equipment shall be decontaminated prior to leaving the site using wet methods approved by the Project Manager and the Health and Safety Officer. All waste generated shall be disposed of in accordance with RF plant requirements.

### 13.0 EMERGENCIES

Preplanning will reduce potential injuries in the result of an emergency. Sampling personnel must receive a building/area indoctrination if applicable or be escorted by an indoctrinated individual. Sampling personnel will become familiar with the locations of emergency egress routes, assembly areas, eye wash safety shower stations, fire extinguisher locations, and nearby telephones.

The sampling team will always have at least one radio and will establish radio contact while out in the field.

RMRS Generic Health and Safety Plan For Characterization Sampling

Document No: RF/RMRS-98-284 Revision No:

Date: Page: January 1999

9 of 10

If any employee is injured or becomes ill, and the situation is life threatening, call 2911. If the situation is not life threatening, transport the employee to Medical at Bldg. 122. If the situation occurs after hours, transport the employee to the Fire Department at Bldg. 331.

In the event unanticipated hazards or conditions are encountered, the project activities will pause to assess the potential hazard or condition. The potential hazard or condition will be evaluated to determine the severity or significance of the hazard or condition and whether the existing project controls are sufficient to address the hazard or condition. Based on this initial evaluation, a determination will be made whether to proceed with the controls currently in place; segregate the condition or hazard from the project activity, if this can be done safely; or curtail operations to address the unexpected hazard or condition. Concurrence to proceed down the selected path must be obtained from the RMRS Director or their designee.

In all cases, notify the following individuals:

#### 14.0 ACTIVITY HAZARD ANALYSIS

An Activity Hazard Analysis (AHA) is required for all projects/sampling events. The AHA need not repeat the requirements detailed in this Health and Safety Program.

#### 15.0 REVIEW AND UPDATE

This program will be amended as necessary. At a minimum, the program will be fully reviewed and updated on an annual basis. Safety inspections will be conducted to determine compliance with this program, the applicable AHA, and the applicable OSHA Health and Safety Standards.

R. S. Roberts, Radiological Engineering Support Services, Bldg. T130B, X4869

SUBJECT:

SCAN SURVEY REQUIREMENTS FOR THE PRE-DEMOLITION SURVEY FOR

THE GROUP B/C FACILITIES-RSR-001-00

The purpose of this correspondence is to document the methodology to be used to perform radiological scan surveys for the Pre-Demolition Survey at the Group B/C facilities.

To perform beta scans for the Group B/C facilities, the following methodology will be used.

- 1. The NE Electra with DP6 Probe will be used.
- 2. The probe will be moved at a speed of 4 inches/second. This corresponds to a scanning MDC of 2525 dpm/100 cm<sup>2</sup> (See Rad Engineering Calculation No. 00-RS-0001, "Beta Scan MDC Calculation For NE Electra with DP6 Probe").
- 3. If elevated activity is found during scanning, perform a 1-minute PAT at that location.
- 4. Record PAT results. If PAT results are  $\geq$  3750 dpm/100 cm<sup>2</sup>, contact radiological engineering.
- 5. Continue scanning.

To perform alpha scan surveys for the Group B/C facilities, the attached methodology outlined in Attachment A will be used. This alpha scan methodology is consistent with the methodology used to perform Final Status Surveys at Building 779. If a 90-second PAT result is  $\geq$  75 dpm/100 cm<sup>2</sup>, contact Radiological Engineering Support Services.

Each survey unit within the Group B/C facilities will have 10% of the surface area scanned for both alpha and beta contamination. Areas with the highest potential for contamination will be scanned.

Subject: Documentation of Beta Scan Requirements For the Group B/C Facilities

To perform beta scans for the Group B/C facilities, the following methodology will be used.

1. The NE Electra with DP6 Probe will be used.

- The probe will be moved at a speed of 4 inches /second. This corresponds to a scanning MDC of 2525 dpm/100 cm<sup>2</sup> (See Rad Engineering Calculation No. 00-RS-0001, "Beta Scan MDC Calculation For NE Electra withDP6 Probe")
- 3. If elevated activity is found during scanning, perform a 1 minute PAT at that location.
- 4. Record PAT results. If PAT results are ≥ 3750 dpm/100 cm², contact radiological engineering.
- Continue scanning.

If it is found that numerous PAT surveys are required using this methodology, the use of a timed PAT of less than one minute duration will be investigated.

If you have any questions or comments, please call.

R.S. Roberts, Radiological Engineering, Bldg. T130B, X4869

SUBJECT:

RADIOLOGICAL SURVEY FORMS FOR THE PRE-DEMOLITION SURVEY

FOR THE GROUP B/C FACILITIES- RSR-002-00

The purpose of this correspondence is to delineate the radiological survey forms that will be used to document total, removable and scan surveys for the Pre-Demolition Survey at the Group B/C facilities.

The following attached survey forms will be used to document the total, removable and scan surveys for the Pre-Demolition Survey at the Group B/C facilities.

- 1. Instrument Data Sheet
- 2. Survey Signature Sheet
- 3. Total Surface Activity Sheet
- 4. Removable Contamination Data Sheet
- 5. Final Survey NE Electra Scan & Investigation Survey Form
- 6. Final Survey NE Electra Scan & Investigation Survey Form (Continuation Sheet)
- 7. Final Survey NE Electra Scan & Investigation Survey Map

These attached survey forms replace RSFORMS-16.02-1, "Total Surface Activity Survey Data Form," RSFORMS-16.02-2, "Removable Surface Activity Data Survey Form," and RSFORMS-16.02-3, "Surface Scanning Data Sheet." The attached forms were used during the Final Status Survey at Building 779, and their use will streamline the process by which radiological surveys are documented. The following changes to the forms are noted.

- The use of a "Probe Correction Factor" and an "Efficiency" is redundant so the use of the "Probe Correction Factor" was discontinued.
- A "Sample Location" with an associated location map is being used instead of both a "Sample/Swipe Number" and "Location/Description" designator. These are equivalent.
- The date of the survey is being recorded instead of both the date and time. This is sufficient for documentation.
- The "Probe Number" has been deleted for swipe survey instruments since no probe is associated with these instruments.

#### APPENDIX 11.1 - POST JOB REVIEW CHECKLIST & INSTRUCTIONS

Instructions for completing the Post Job Review Checklist.

- 1. Enter the work document number and the date the form was completed.
- 2. Enter the name of the Job Supervisor who was responsible for the performance of the work. (This person **SHALL** lead the PJR.)
- 3. Evaluate how well the activity went. Check the appropriate box, and provide comments to clarify needs identified during the work or to suggest improvements. In addition to mentioning areas for improvement, when the process is excellent it can be beneficial to say why it went so well. This positive feedback may increase the likelihood that the performance will be repeated.

#### Additional Information to clarify the evaluation

The following section provides some narrative descriptions for some of the key questions on the PJR checklist.

- 1. Safety Barriers Were Effective (Item 1) is intended to capture issues and suggestions related to the adequacy of the safety during the work. The review Should consider the adequacy of the safety hazard identification, special safety equipment, safety coordination and support, pre-job briefing, and worker performance during the job.
- 2. System, Component, and Support Were Ready for Work (Item 6) is intended to evaluate the physical conditions needed to perform the work. It considers whether the equipment and system being worked on were in a condition where work could be performed as scheduled. This evaluation includes the coordination between planning, operations, maintenance and support organizations to ensure proper configuration and condition of work site equipment.
- 3. Support Coverage Was Adequate (Item 9) is intended to evaluate the coordination and cooperation between support organizations and the worker(s) performing the work. It includes having key people available when needed and having cooperation between work groups to accomplish the work.

Unacceptable = Significant delays encountered, key people not available, major conflict between

work groups

Marginal = Minor delays encountered, coordination break downs, some conflict between

work groups

Good = No delays encountered, good coordination or cooperation, but not both

Excellent = Support ready to work as planned, good coordination and cooperation between

work groups

4. Environmental Barriers Were Effective (Item 10) is intended to capture issues and suggestions related to the adequacy of the environmental controls during the work. The review Should consider the adequacy of the environmental hazard identification, special equipment, coordination and support, pre-job briefing, and worker performance during the job.

- 5. Work Document Was Adequate (Item 11) is intended to capture issues and suggestions related to the adequacy of the work document. These include evaluating that the work instructions were appropriate and comprehensive, that instructions were clear, drawings and references were appropriate and comprehensive, tools equipment and processes used to accomplish the work were appropriate, and identifies any contributing factors that helped improve the job performance.
- 6. Other (Description) (Item 12) This section is provided to allow individuals to identify improvement opportunities that do not seem to fit in the other sections. It should also be used to indicate when an occurrence report has been generated as a result of an incident that occurred during performance of the work. Provide additional information in the comment section of the checklist.

#### 7. The *Comment Section* should be used to:

- Provide clarifying information about the PJR
- Provide specific suggestions to improve work performance in the future

#### Some example comments are provided below:

- # 1 The lifting straps issued for the work were found to be damaged during the pre-job preparation. The damaged straps were returned to the tool room for disposal. Good straps were drawn from stock. We need to ensure that straps are inspected prior to being issued by the tool room.
- #9 The Radiation Safety coverage was not available for the first two hours of the scheduled work.

  They were called over to support an unplanned shipment of casks. We need to follow the plan of the day or let people know when conditions change. We could have completed another work order while we waited if we had known this was going to happen.
- #11 This work document was well prepared. The preparer walked the job down with the team prior to preparing the document. During the walkdown we considered several alternatives and determined that by removing some grating we could save more than 5 hours in the pump replacement. This worked great!
- Lessons Learned This section is provided to allow individuals to submit the lessons learned from the project to the Lessons Learned program. A background of the project should be given, followed by the lessons learned during the project.

(Contained in separate ) binder due to its size)
